*The above data is typical value. As all units have nearly the same characteristics, the data to be considered as ability value.

1. Calculated value of MTBF

MODEL : 10V-20A

(1) Calculating Method

Method of calculation according to MIL-HDBK-217F.

Individual failure rates is given to each part, and MTBF is calculated by the count of each part.

Formula:

$$MTBF = \frac{1}{\lambda_{equip}} \times 10^6 = \frac{1}{\sum_{i=1}^n N_i (\lambda_G \pi_Q)_i} \times 10^6 (hours)$$

Where:

λ_{equip} = Total Equipment Failure Rate (Failures / 10^6 Hours)

λ_G = Generic Failure Rate For The i th Generic Part (Failure / 10^6 Hours)

N_i = Quantity of i th Generic Part

n = Number of Different Generic Part Categories

π_Q = Generic Quality factor for the i th Generic Part ($\pi_Q = 1$)

(2) MTBF Values

G_F : (GROUND, FIXED)

MTBF = 78778 (HOURS)

(MTBF calculation for fan isn't included.)

2. Components derating

MODEL : 10V-20A

(1) Calculation method

1. Measuring Conditions

Input: 100 , 200Vac

Ambient temperature: 50°C

Output: 10V - 20A (100%)

Mounting Method: Standard Mounting

2. Semiconductors

Compared with maximum junction temperature and actual one which is calculated based on on case temperature, power dissipation and thermal impedance.

3. IC, Resistors, Capasitors, etc.

Ambient temperature, operating conditions, power dissipation and so on are within derating criteria.

4. Calculation Method of Thermal Impedance:

$$\Theta_{j-c} = \frac{T_{j(\max)} - T_c}{P_{c(\max)}} \quad \Theta_{j-a} = \frac{T_{j(\max)} - T_a}{P_{c(\max)}}$$

T_c : Case temperature at start point of derating; 25°C in general

T_a : Ambient temperature at start point of derating; 25°C in General

$P_{c(\max)}$: Maximum power dissipation

$T_{j(\max)}$: Maximum junction temperature

Θ_{j-c} : Thermal impedance between junction and case

Θ_{j-a} : Thermal impedance between junction and air
